

Common Cognitive Distortions

Thinking shortcuts can feel convincing. Naming them creates room for a more accurate response.

Patterns to notice

All-or-nothing thinking	Seeing only total success or total failure, with no middle ground.
Overgeneralizing	Treating one event as proof of an enduring pattern.
Mental filter	Focusing on the negative while discounting relevant positive information.
Mind reading	Assuming you know what someone thinks without enough evidence.
Fortune telling	Predicting a negative outcome as though it is already settled.
Catastrophizing	Jumping to the worst possible outcome or underestimating your ability to cope.
Emotional reasoning	Assuming that because something feels true, it must be true.
Should statements	Using rigid rules that create shame, anger, or unrealistic expectations.
Labeling	Reducing a whole person to a global judgment based on one behavior or mistake.
Personalization	Taking excessive responsibility for outcomes influenced by many factors.

Try a more flexible question

- What facts am I using, and what important facts might I be leaving out?
- What is the most likely outcome - not only the worst outcome?
- Can I describe the behavior without turning it into a label?
- Would words such as prefer, hope, or value be more accurate than should?
